

AZURE GUARDIAN COIN

Cexius Exchange Listing Packet • Project Overview

Azure Guardian Coin (AZURE) is an independent native UTXO cryptocurrency powering the Azure Guardians ecosystem: a live Discord RPG, player reward system, native NFT collectibles, and an operational NFT marketplace.

Project Snapshot

Project	Azure Guardian Coin
Ticker	AZURE
Asset type	Native UTXO coin / independent blockchain
Consensus	Proof of Work; AuxPoW chain ID 1901
Target block time	~90 seconds
Current block reward	500 AZURE
Premine	5,000,000 AZURE
Supply model	No fixed maximum; 15 AZURE/block permanent tail after year 15

Why AZURE Has Utility

- Azure Guardians: The Journey to Balganox is an actively developed Discord RPG with exploration, combat, bosses, crafting, equipment, missions, progression, and story chapters.
- Players earn defined AZURE reward progress through gameplay milestones; payouts use native AZURE wallet infrastructure.
- The ecosystem includes limited native Genesis NFT collectibles, in-game NFT utility, and a live marketplace.
- AZURE is the settlement asset for player rewards, marketplace purchases, and expanding ecosystem utility.

Suggested Listing Pair

Primary requested market: AZURE/USDT - a straightforward liquidity and price-discovery pair for miners, players, collectors, and community members.

TECHNICAL INTEGRATION SHEET

AZURE Mainnet • Exchange Node and Wallet Reference

Canonical Mainnet Parameters

Node / client	0.7.7 /Bloodstone:0.7.7/
Protocol	120018
Default ports	P2P 29825 RPC 49825 (private/localhost only)
Seed peer	64.188.22.190:29825
Genesis	f5e7c12a9a232c07a30835c7934db52ce7372dae41fbe62eedcb36aa5bed87e0
Addresses	Legacy A... Bech32 azure1... HRP azure
AuxPoW chain ID	1901
Recommended index	txindex=1

Recommended Exchange Node Setup

- Run a dedicated AZURE 0.7.7 full node with txindex=1 and no pruning.
- Keep JSON-RPC on localhost or private infrastructure; never expose RPC publicly.
- Verify chain identity by the AZURE genesis hash and network parameters, not inherited cosmetic CLI/help labels.
- Determine deposit confirmations from the exchange's own node, not the public explorer.

Wallet/RPC Functions Verified

Deposit addresses	getnewaddress
Validation	validateaddress
Transaction lookup	gettransaction
Withdrawals	sendtoaddress
Address types	legacy, p2sh-segwit, bech32

Deposit Confirmation Policy

Normal deposits	6 confirmations recommended
High-value deposits	12 confirmations recommended

Integration Note

Some RPC help text still contains inherited names such as STONE or SpaceXpanse. These strings are cosmetic; the live AZURE chain is identified by its own genesis hash, ports, address prefixes, peers, and consensus rules.

Live Verification Snapshot

Production audit confirmed a fully synced mainnet node, canonical genesis, 500-AZURE current reward, seed peer 64.188.22.190:29825, valid A... and azure1... addresses, and txindex=1.

TOKENOMICS & SUPPLY

AZURE Issuance Schedule • Live Supply Snapshot

Current Supply Snapshot

Snapshot height	19,150
On-chain unspent supply	9,630,409 AZURE
Genesis premine	5,000,000 AZURE
Pre-POST_ICO issuance	Blocks 1-9,909: 1 AZURE/block
POST_ICO start	Height 9,910
Current issuance	500 AZURE/block

Supply reconciliation at height 19,150: 5,000,000 premine + 9,909 pre-fork coins + 4,620,500 post-fork coins = 9,630,409 AZURE.

Long-Term Issuance Schedule

Block range	Approx. period	Reward
0-1,051,919*	First 3 issuance years	500 AZURE/block**
1,051,920-2,103,839	Years 3-6	250 AZURE/block
2,103,840-3,155,759	Years 6-9	125 AZURE/block
3,155,760-4,207,679	Years 9-12	62.5 AZURE/block
4,207,680-5,259,599	Years 12-15	31.25 AZURE/block
5,259,600 onward	Year 15+	15 AZURE/block permanent tail

* Consensus uses 350,640 blocks/year. **Historical blocks before POST_ICO height 9,910 paid 1 AZURE/block; the 500-AZURE schedule applies after the fork.

Supply Classification

- AZURE has no fixed hard cap because the chain transitions to a permanent 15-AZURE/block tail emission after year 15.
- 9,630,409 AZURE is the audited UTXO-set total. An exchange may define circulating supply differently if treasury-held premine is excluded.

Technical Sources Used

Live AZURE mainnet audit (September 2026) and the public Bloodstone-Team/azure source tree, including chainparams.cpp and validation.cpp. Current consensus behavior is used instead of older promotional tokenomics.
